Where should we make snow first?

- Snow is not evenly available
- Water and energy are limited
- Decisions must be made early and with precision
- The French Alps host the 2030 Winter Olympics

A ski slope is not uniform

Conditions change from one zone to another

Snow retention and wind exposure vary across the slope

Snowmaking depends on water, energy and the right weather

Existing data is not always local or frequent enough

What if we tracked key zones regularly to match production to real needs?

Introducing SnowZone AI

Produce the right snow, in the right place, at the right time.

Smart sensors measure key conditions

Data combined with forecasts

AI analyses patterns and predicts needs

Clear recommendations on where, when and why

Decision support for operators.

Operators stay in control.

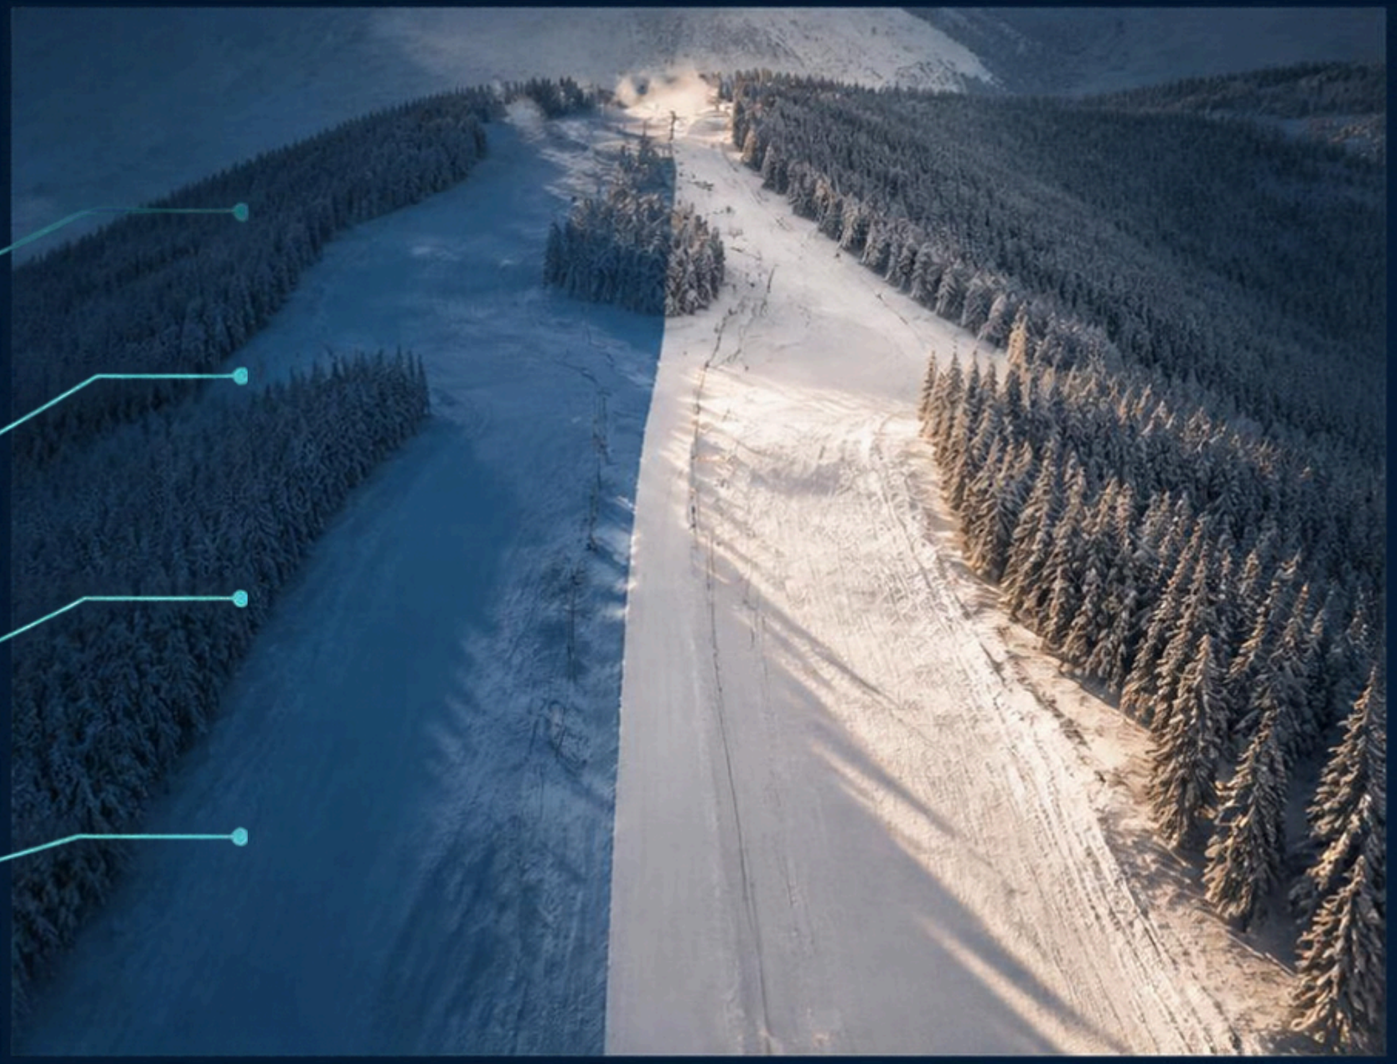

What makes it different

Observe locally
shaded vs sunny areas behave differently

Anticipate needs
spot zones at risk before they escalate

Prioritise smartly
respect water and energy constraints

Work alongside existing tools
complements, doesn’t replace

IMPACT ÉCONOMIQUE ET ENVIRONNEMENTAL

10 000 m³
de neige produite

4 000 m³ d'eau
15 000 à 30 000 kWh

3 000 à 6 000 €
d'électricité à 0,20 €/kWh

Avec 10 % de production inutile évitée

400
m³ d'eau

1 500 à 3 000
kWh

300 à 600 €
d'électricité évités

Notre valeur ajoutée : **plus de précision locale** pour réduire les dépenses sans compromettre l'enneigement nécessaire
